If you are experiencing knee pain due to arthritis, are between 40 and 80 years of age, and have in the past tried treatments such as anti-inflammatory medications, physical therapy, or local joint injections without success, you may be eligible to participate in a clinical trial of knee embolization for knee arthritis.

If you are eligible, you would undergo a minimally invasive Genicular Artery Embolization procedure, which is done under moderate sedation. The procedure involves the insertion of a small catheter into the blood vessel of the leg, in an effort to decrease painful inflammation in the knee. The procedure takes about 2 hours, and you are discharged that day. The physicians are highly experienced in minimally invasive image-guided interventions, having successfully performed embolization procedures in thousands of patients.

The costs of the procedure and all follow-up visits are funded by the study - nothing will be billed to you or your insurance company. Your participation in this study is entirely voluntary. If you choose to partake in this study, you can decide to withdraw at any time.
